COMP 6905: Software Engineering

Group: 6

Implemented Improvements

1. 404 Not Found Page

Implemented a dedicated 404 page that is displayed whenever the user navigates to a URL path that does not correspond to an existing route.

2. Removal of console.log Statements

Removed all console.log() statements from the codebase as requested.

3. Removal of .env.local from the Repository

Removed the .env.local file from version control to avoid exposing sensitive configuration values.

4. Pagination on Expenses Page

Added pagination to the expenses page to prevent it from becoming an excessively long, scrollable list when many expenses are present. The page now shows up to 15 expenses per page, with navigation to additional pages as needed.

5. Profile Avatar UI Correction

Fixed the minor UI issue affecting the profile avatar so that it now displays as originally intended and is visually consistent with the rest of the interface.

6. Amount Validation

Implemented validation on the expense amount field to prevent incredibly large values (more than 1,000,000,000) from being submitted.

Planned but Not Completed (With Justification)

1. Changing Cypress cy.visit() Path from / to src

Attempted to change the Cypress cy.visit() target from / to src to optimize testing. However, this modification caused multiple end-to-end tests to fail. Given the time constraints and the priority to maintain a passing test suite, the change was reverted.

2. manifest.json Updates

Improvements to manifest.json were considered. These changes were deprioritised due to limited time, as they are non-critical to core functionality and would have required additional testing to ensure no errors.

3. Firebase Rate Limiter

Investigated adding rate limiting in Firebase to protect against abusive usage patterns. Implementing a robust and correctly configured rate limiter would have required significant additional development and testing effort, which was not feasible within the remaining time.

4. Vercel Headers and Security Configuration

Planned to introduce stricter security headers and configuration at the Vercel deployment level (e.g., improved HTTP security headers). These tasks were postponed due to time pressure and testing-related items.

5. Mobile Responsiveness (Not up to the mark)

We have planned to improve the responsiveness of the website for mobile as well. It is there, but not as perfect as it's supposed to be. Just for the sake of time constraints, we were not able to fix the responsiveness bugs in this version of our website.

Overall, the implemented changes focus on user experience, security hygiene, and maintainability, while the deferred items were mainly postponed due to the risk of breaking existing tests and the limited time available for safe implementation and verification.
